Repair and Maintenance/Test and Repair

This training is designed to make staff aware of the inherent hazards a person may encounter when moving various items of machinery in a work environment. This unit only allows the operation of the equipment in a non-load shifting capacity so that equipment may be moved around a site by suitably trained staff.

The theory session will take **1 to 2hrs** (Depending on experience) and will cover:

- Risk Assessment
- Machine inspections
- Basic fault finding and rectification
- Use of a spotter and hand signals
- Start up and shut down procedures

The practical component will be completed both as a group as well as on an individual basis.

The practical session will take between **4-5 hrs** and will cover:

- Inspect the worksite for hazards/JSA
- Pre-operational checks
- Planning of the task
- Drive various types of equipment in a work environment
- Shut down and secure the equipment
- Use of a spotter/hand signals

Please note: Although we try and have a good example of machines to operate on the day it cannot be taken for granted that all machines (of a similar type) are the same and familiarisation on new machines must be sought prior to the operator moving it.
